

Let $n \in \mathbb{N}$, $\mathbf{x} \in \mathbb{N}^n$ and

$$\psi(t) = 2^n \prod_{k=1}^n \cos(x_k t) = \sum_{\sigma \in \{-1,1\}^n} \cos t \langle \mathbf{x}, \sigma \rangle \quad (1)$$

equivalently (recalling the cosine is even)

$$\psi(t) = \prod_{k=1}^n (e^{ix_k t} + e^{-ix_k t}) = 2 \sum_{\sigma \in \{-1,1\}^n} e^{it \langle \mathbf{x}, \sigma \rangle} \quad (2)$$

put

$$c_k = |\{\sigma \in \{-1,1\}^n \mid \langle \mathbf{x}, \sigma \rangle = k\}| \quad (3)$$

is the number of partitions that sum to k , then

$$\frac{1}{2n} \sum_{m=1}^n \psi\left(2\pi \frac{m}{n} + i \ln 2\right) = \sum_{\sigma \in \{-1,1\}^n} \frac{1}{n} \sum_{m=1}^n e^{2\pi i \frac{m}{n} \langle \mathbf{x}, \sigma \rangle} 2^{-\langle \mathbf{x}, \sigma \rangle} \quad (4)$$

$$= \sum_{k=-\infty}^{\infty} c_{kn} 2^{-nk} \leq c_0 + 2^{1-n} \quad (5)$$

where the transition from (4) to (5) is due to summation of roots of unity, that sum to zero on (4) iff n does not divide $\langle \mathbf{x}, \sigma \rangle$, and if it does divide then they sum to n . We have proved that \mathbf{x} has a zero partition iff

$$\frac{1}{2n} \sum_{m=1}^n 2^n \prod_{k=1}^n \cos\left(2\pi \frac{m}{n} + i \ln 2\right) \geq 1 \quad (6)$$
